

# What are the Common Baby Foods?

## Detail Introduction :

Baby food is essential for the growth and development of babies. When babies reach a certain growth, they need food other than breast milk to supplement their body's nutritional needs. Ba Production Line can produce a wide range of high quality baby food to meet the needs of growing What are the most common baby foods?

Currently, the five most common types of infant food are formula, complementary foods (cereal pow fillings), nutritional supplements and infant formula for special medical purposes. Infant food s provided according to the growth and development of the infant, and the food needed varies accord age.

Formula can provide infants with the nutrition they need for growth and development and i substitute for breast milk. There are two main types of formula, one is milk-based infant formula what we commonly call infant formula, and the other is soya-based infant formula.

The two main types of common complementary foods for infants are cereal-based and filled foods. types of cereal-based foods are rice flour, biscuits, nutritional powders, noodles, etc. Among th fortified rice flour is the most commonly consumed, which can supplement the deficiency of breast has rich nutrition, prepare for weaning, and has a great role in promoting the growth and develo infants.

Filled foods refer to foods in sealed containers, ready to eat semi-liquid foods such as juices, vegetable purees, meat purees and vegetable purees, etc. They can provide infants with sufficient vitamins, and dietary fibre to supplement their growing needs.

Infants often take probiotics, calcium, iron and zinc supplements, VD and DHA, etc. Before birth, inf a certain amount of vitamin reserves in their bodies and normally do not need additional supplement

first two months, but if the supply of nutrients in breast milk is not sufficient, the vitamin reserves in the infant's body will be quickly depleted and nutritional supplements are needed at this time.

Infant formulae for special medical purposes refer to foods in powder or liquid form designed to meet the nutritional needs of infants with special medical conditions such as special disorders and diseases. Commonly available are lactose-free or low-lactose formulas, partially hydrolysed milk protein formulas, extensively hydrolysed milk protein formulas or amino acid formulas, and breast milk supplements, etc. The conditions for which different types are available vary.

This is an introduction to the types of common baby foods. When choosing foods for babies, you should choose good quality, healthy foods for them that are suitable for their growth and development. It is important to pay attention to some issues when feeding your baby and the correct way to feed them to ensure their healthy growth.

Notes on adding baby food:

1. Adding baby food should be done gradually and slowly, from less to more, from thin to thick, from fine to coarse, and when the baby is used to the new food, increase the amount slowly.
  2. When adding baby food, if the baby cannot accept it for the time being, try again next time or change the way you eat it, as some foods require several attempts to be accepted by babies.
  3. The infant food should be diversified, the taste should also be rich and diverse, mixed cereals, vegetables and fruits should be involved, so as to ensure a comprehensive and balanced intake of nutrients.
