How Do You Dry Fresh Red Dates?

For the Sanitation and disinsectisation of dates, Conventional heating and sterilization methods such as flame, hot air, electric heating, steam drying, etc. all use the principle of heat conduction to transfer heat from the outside of the heated object to the inside. It takes a certain amount of time for conventional drying and sterilization to bring the central part to the required temperature, and it takes longer for objects with poor thermal conductivity.

The principle of Loyal continuous microwave oven equipment is to gradually increase the center temperature of the object. , called external heating. And the drying characteristics of industrial microwave dryer for dates, microwave energy can penetrate the inside and outside of the object to heat at the same time, the frequency is 2450MHZ, with 2.45 billion oscillations per second, the molecules rub against each other to generate heat, and self-heating, so as to achieve harmless for the purpose of sterilization and drying.
