Features Of Microwave Drying

Uniform Heating	As microwave acts on water molecules, so the part with high water content absorbs more microwave power than the part with lower water content. This is the characteristic of selective heating, using this feature can achieve uniform heating and uniform drying.
High Efficiency And Energy Saving	Microwave is directly on the role of materials, so there is no additional heat loss, the air in the furnace and the corresponding container will not heat, so the thermal efficiency is very high, the production environment is also significantly improved, compared with far infrared heating can save 30% of electricity.

High Efficiency Short Time	Because microwave heating does not require the process of heat conduction, so the microwave penetrates the object from different directions into the object inside, from inside to outside so that the material in a very short time to achieve uniform drying, effectively shortening the drying time.
Easy To Control	Compared with conventional methods, microwave operation is easy; microwave power adjustable, adjustable transmission speed.
