The microwave drying and sterilizing equipment for pumpkin seeds has a fast heating speed. Microwave heating makes the heated object itself a heating body, which is called an internal heating method. It does not require the process of heat conduction. Pumpkin seeds microwave dryer equipment adopts low temperature sterilization and no pollution. Microwave energy itself will not contaminate food, and the double sterilization effect of microwave thermal effect can kill bacteria at a lower temperature, which provides a heat sterilization method that can maintain more nutrients in food. Pumpkin seeds microwave drying equipment evenly heats conventional heating, in order to increase the heating speed, it is necessary to increase the heating temperature, which is prone to the phenomenon of external coke and endogenesis.

HOW TO DRY PUMPKIN SEEDS?

Microwaves are electromagnetic waves that generate high-frequency electromagnetic fields. The heating medium material consists of polar molecules and non-polar molecules. The water molecules in the material are polar molecules. Under the action of the electromagnetic field, the polar molecules change from the original random distribution state to the polarity. according to the polarity of the electric field. Molecular motion and friction against each other generate energy that continuously increases the temperature of the material. A series of physicochemical processes are produced for heating and puffing to achieve the purpose of thermal drying and drying of pumpkin seeds.
